How Many Tonnes of Copper Are Sold a Year

Fawaz Trading & Engineering Services - Trading Division, Copper and Spare Parts. 10-11-2026. Three ways of getting at the same number.

The answer - from the physical stock movement			
Landed into the warehouse 2021 to date (MT)	836.953		898.516 bought less 61.563 not in yet
In the warehouse at 05-11-2026 (MT)	10.717		2,438 pcs
So sold over the period (MT)	826.236		assumes the warehouse was empty at 01-01-2021
Months covered	70.3		01-01-2021 to 10-11-2026
SOLD PER MONTH (MT)	**11.750**		**the whole company**
SOLD PER YEAR (MT)	**141.000**		**the whole company**

The three figures side by side			
Method	**MT per year**	**MT per month**	**Comment**
Physical stock movement 2021-2026	141.0	11.8	826 MT through the warehouse over 70 months
copper_master yearly consumption	109.8	9.2	the figure the 34.5 MT order recommendation is built on
Average landed per year 2021-2026	149.8	12.5	what came in, not what went out
Gap between the first two (MT/yr)	**31.2**		**copper_master understates offtake by 29%**

Ahmed Nabil's share			
2024 - share of the division's sales	59.6%		791,687 of 1,328,880 KWD
2025 - share of the division's sales	63.2%		768,824 of 1,215,899 KWD
So his copper, if it splits like the sales (MT/yr)	**86.6**		**61.4% average of 2024 and 2025**

NOTES

1. THE COGS IN THE SALES REPORT CANNOT BE DIVIDED BY THE COPPER COST TO GET TONNES. It covers everything the sub profit centre sells, not copper tube alone. Sheet 1 shows the arithmetic: the division's 2024 COGS of 1,038,230 KWD comes to 283 MT at the copper rate, against 107 MT of copper that actually landed that year. Copper is roughly 38% of the division's cost in 2024 and 61% in 2025.
2. To turn the COGS into tonnes exactly, run the same Sales Analysis Report filtered to the copper tube item codes (15120xxx for straight tube, 15100xxx for coil). Divide that COGS by the KWD per tonne on sheet 1 and the answer is firm. Everything is set up for it.
3. The physical figure assumes the warehouse was empty at 01-01-2021. If there was opening stock, real sales are higher than 141 MT a year, not lower.
4. The 2026 landing of 189.726 MT includes 47.563 MT still at sea and the 14.000 MT Mueller order, which is why 61.563 MT is taken out before the balance.
5. 141 MT a year against the 109.8 MT copper_master works on means cover is about 2.2 months, not 2.8, and the recommended 34.5 MT order is roughly 10 MT light for the same cover.

Ahmed Nabil Mohamed Abdalla - Sales, Cost and Implied Tonnes

From the Sales Analysis Reports for 2024 and 2025, sub profit centre TRDACREF, plus the 2026 close of 950,000 KWD at a 21% margin. Kuwaiti dinars.

Year	Sales (KWD)	COGS (KWD)	Margin (KWD)	Margin %	Copper cost (KWD/t)	COGS / cost (MT)	Copper landed company (MT)	Comment
2024	791,687	647,406	134,269	17.0%	3,675	176.2	107.199	Implied tonnes exceed all the copper that landed - COGS is not copper only
2025	768,824	631,623	133,814	17.4%	3,586	176.1	162.471	Same again: 176 MT implied against 162 MT landed company-wide
2026	950,000	750,500	199,500	21.0%	4,677	160.5	189.726	Projection. Margin up 3.6 points while copper cost rose 30% - see note 2

THE WHOLE SUB PROFIT CENTRE - WHY THE COGS CANNOT BE DIVIDED

Year	Division sales (KWD)	Division COGS (KWD)	Margin %	Copper cost (KWD/t)	COGS / cost (MT)	Copper landed (MT)	Copper as % of division COGS	What it means
2024	1,328,880	1,038,230	21.9%	3,675	282.5	107.199	37.9%	283 MT implied against 107 MT landed - impossible
2025	1,215,899	953,202	21.6%	3,586	265.8	162.471	61.1%	266 MT implied against 162 MT landed - impossible

THE 2026 PROJECTION AGAINST 2025

Line	2025	2026	Change	%				Comment
Sales (KWD)	768,824	950,000	181,176	23.6%				Growth of 181,176 KWD
COGS (KWD	631,623	750,500	118,877	18.8%				Rising slower than sales
Margin (KWD	133,814	199,500	65,686	49.1%				Up by half
Copper cost	3,586	4,676	1,090	30.4%				Cost per tonne up 30% - but margin widens anyway
Margin %	**17.4%**	**21.0%**	**3.6%**					**3.6 points. Selling off stock bought before the run-up**

NOTES

1. Copper cost per tonne is the receipt-year rate from copper_stock_cost.xlsx, taken all the way to landed: FOB x 1.02 for freight and insurance x 1.07 for 5% customs and 2% expenses, at 1 USD = 0.308 KWD. The 2% freight comes from the two invoices in copper_cost_comparison, where CIF runs 1.0% and 2.8% over FOB.
2. THE MARGIN STORY: copper landed cost per tonne rose 30% from 2025 to 2026, yet the margin widens 3.6 points. That fits what the purchase data shows - the material sold in 2026 was bought 633 $/t below the 2026 order price, because the dear orders of late 2025 and August 2026 had not landed. The selling price follows today's LME while the cost still carries yesterday's. It is a real gain, but it is a timing gain and it reverses.
3. WHAT REVERSES IT: the 47.563 MT at sea was bought at 13,740 and 14,250 $/t, and the orders landing in 2027 will be priced off an LME near 14,250. On 2026 selling prices that takes roughly 4 to 5 points off the margin. Holding 21% into 2027 needs the selling price to move with it.
4. COGS in these reports is everything the salesman sold, not copper tube alone. The open order book gives a feel for the mix: of 212,885 KWD across the seven orders in hand, 3,753 KWD is Muller fittings and coil, so on those orders copper tube is 98%. Across a whole year it is clearly much less - see the block above.
5. The 2026 line is the projection given, not reported figures. 2024 and 2025 are as printed on the reports of 10-11-2026.
