Tonnes of Copper Sold - 2024, 2025, 2026

Ahmed Nabil Mohamed Abdalla. Copper cost of sales divided by the average cost a tonne of the material it was bought at. The metal sold in a year is priced about six months earlier - 3.5 months to make and ship, then time in stock. Cost = (LME + fabrication) + 1% freight + 5% customs. 1 USD = 0.308 KWD.

Year	Copper COGS (KWD)	Average LME ($/t)	Cost per tonne (KWD/t)	TONNES SOLD	Metal bought in the window (MT)	Which orders the cost comes from
2024	647,406	9,072	3,383	191.4	126.5	placed Jul 2023 to Jul 2024
2025	631,623	9,156	3,478	181.6	175.3	placed Jul 2024 to Jul 2025
2026	750,500	11,670	4,281	175.3	137.8	placed Jul 2025 to Jul 2026
3 years	**2,029,529**		**3,702**	**548.3**		**Average 182.8 MT a year**

1. Tonnes sold = your copper cost of sales divided by the cost a tonne of the metal that was actually sold.
2. That metal was not bought in the year it was sold. Nungwon takes 3.5 months to make and ship, and the tube then sits in stock about 2.5 months, so what is sold in a year was priced about six months earlier. Each year is therefore costed on the orders PLACED in the twelve months ending six months before that year closes.
3. Cost a tonne = (LME + fabrication) x 1% freight x 5% customs, at 1 USD = 0.308 KWD. Fabrication is 1,600 $/t Nungwon and 700 $/t Toan Phat. Mueller carries no freight and no customs - it ships from Bahrain - at an LME of 14,450 plus 1,600.
4. COGS is yours as printed on the Sales Analysis Reports of 10-11-2026, sub profit centre TRDACREF: 647,406.340 KWD in 2024 and 631,622.779 in 2025. 2026 is the 950,000 KWD close at a 21% margin.
5. The whole of your COGS is treated as copper tube. If part of it is fittings or other material, every year comes down in the same proportion and the shape of the three years does not change.
